

FOOT MASSAGE SYSTEM FOR TUB AND METHOD

ABSTRACT

A foot massage system for a tub, comprising a fluid injection system for creating a flow of fluid. Outlets are interconnected to the fluid injection system so as to receive the flow of fluid. The outlets are adapted to be secured through a tub wall so as to inject the fluid in the liquid of the tub to create a turbulence in the liquid of the tub. A foot support is adapted to be secured in the tub, for receiving at least one foot of a person seated in the tub. The foot support is positioned relative to the outlet such that the fluid exiting the outlet creates a massaging effect on the foot received in the foot support.
